

Vertical Roll Around Tunnel

Catalog # 34003

The Vertical Roll Around Tunnel (pictured at right) provides access from top to bottom of paired cages on a rack system.

Transports animals from one place to another.

There is a removable aluminum divider and foraging tray at the mid-section of the tunnel to provide separate upper and lower spaces of containment.

A waste tray at the bottom of the tunnel drains into an existing rack waste system.

A latched door closes to lock the foraging tray and or divider into place.

A digital scale (pictured below) can be used in place of the foraging tray for weighing animals.

The tunnel can be used with many different styles of rack systems.
